The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide to be trimerized, and introducing the construct into a first polypeptide to be trimerized, and introducing the construct into a clararyotic cell. Receptor decoys, e.g. soluble receptors consisting of culty the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much injer affinity to their ligand than their dimeric counterparts. Such rationally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of increase clinical benefits, as well as lower the amount or frequency of drug injections for each patient. The method of the invention may be useful for generating a secreted trimeric fusion protein to be used for maturally occurring trimeric ligands. The current sequence is that of the human soluble CD4-TRO of the invention. The collagen 12 fusion protein (GD4-T2) of the invention. The collagen T2 construct includes a mutated applying the construct includes a content of the broad and the construct includes a content of the broad and the construct includes a content of the broad and the construct includes a content of the broad and the construct includes a content of the broad and the construct includes a content of the broad and the construct includes a content of the broad and the construct includes a content of the broad and the construct includes a content of the broad and the construct includes a content of the broad and the construct includes a content of the broad and the construct includes and the construct of the construct of the construct

The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide to be trimerized, and introducing the construct into a first polypeptide to be trimerized, and introducing the construct into a cukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of culy the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much rationally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of cury injections for each patient. The method of the invention may be useful for generating a secreted trimeric fusion protein to be used for naturally occurring trimeric ligands. The current sequence is that of the human placental alkaliae phosphatase (AP)-human collagen alpha (I) construct includes a mutated BNP-1 recognition site but does not contain
                                                                                                                                                                                                                                                                                                                                                                             Generating a secreted trimeric fusion protein by introducing into a cell a DNA construct comprising a promoter linked to a template encoding a signal peptide sequence followed by in-frame fusion to polypeptide to be

The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion. to the polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide to be trimerized, and introducing the construct into a cukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of only the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much higher affinity to their ligand than their dimeric counterparts. Such rationally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of drug injections for each patient. The method of the invention may be useful for generating a secreted trimeric fusion protein to be used for maturally occurring trimeric ligands. The current sequence is that of the naturally occurring trimeric ligands alpha(1) C-propeptide T2 fusion protein (sTMF-T1) which is a protein (sTMF-T1-T2) and invention. The collagent to be the continuents. includes a mutated BMP-1 recognition site but does not contain the glycine-repeat triple helical region.

The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide to be trimerized, and introducing the construct into a eukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of enly the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much higher affinity to their ligand than their dimeric counterparies. Such rationally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of

              useful for generating a secreted trimeric fusion protein to be used for more efficient neutralization of the biological activities of their maturally occurring trimeric ligands. The current sequence is that of the human collagen alpha(I) C-propebtide TO construct protein of the invention. The construct includes a partial glycine-repeat triple helical
                                                                                                                                                                                                                                                                                                                  122

The invention relates to a novel method for generating a secreted crimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide to be trimerized, which in turn is joined in-frame to a polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide capable of self-trimerization which is heterologous to the first polypeptide to be trimerized, and introducing the construct into a cukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of only the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much higher affinity to their ligand than their dimeric counterparts. Such rationally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of cutual injections for each patient. The method of the invention may be useful for generating a secreted trimeric fusion protein to be used for more efficient neutralization of the biological activities of their channer sequence is that of the name soluble TNP-RII-human collagen The current sequence is that of the human soluble TNP-RII-TO) of the invention. The collagen TO construct includes a partial glycine-repeat triple helical region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              QCCNLDAI KVFCNMETGETCVY PTQPSVAQKNWYI SKNPKDKRHVWFGESMTDGFQFEYG 441

The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the colypeptide to be trimerized, which in turn is joined in-frame to a colypeptide to be trimerized, which in turn is joined in-frame to a colypeptide to be trimerized, and introducing the construct into a creative to the tirst polypeptide to be trimerized, and introducing the construct into a contract cellular ligand-binding domain, may be used to intercept a conty the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much rationally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of increase clinical benefits, as well as lower the amount or frequency of cuseful for generating a secreted trimeric fusion protein to be used for more efficient neutralization of the biological activities of their manners of the invention. The cultagen alpha(1) C-propeptide TO fusion protein (SCD4-TO) of the invention. The collagen TO construct includes a partial construct repeat triple helical region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     63 QGCNLDAIKVFCNMETGETCVYPTQPSVAQKNWYISKNPKDKRHVWFGESMTDGFQFEYG 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the cignal peptide to be trimerized, which in turn is joined in-frame to a colypeptide capable of self-trimerization which is hererologous to the first polypeptide to be trimerized, and introducing the construct into a cukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of cukaryotic cell. Receptor decoys, e.g. soluble receptors during disease con ly the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much rationally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of increase clinical benefits, as well as lower the amount or frequency of cury injections for each patient. The method of the invention may be useful for generating a secreted trimeric fusion protein to be used for more efficient neutralization of the biological activities of their construct includes a partial glycine-repeat triple helical region.
                                                                                                                                                                                                                                    Human alkaline phosphatase-collagen alpha(I) C-propeptide fusion protein.

The invention relates to a novel isolated polynucleotide comprising any of the 235 nucleotide sequences described in the specification. The invention further comprises: an isolated polynucleotide encoding a playestic for the 235 nucleotide activity, where the polynucleotide hybridizes to polypeptide with biological activity, where the polynucleotide hybridizes to one of the 235 novel polynucleotides under stringent hybridization comprises than about 99% sequence identity with the novel polynucleotide; a vector comprising a novel polynucleotide; and captession vector comprise the novel polynucleotide, which can be operatively associated with a regulatory sequence that modulates expression of the polynucleotide in the host cell; an isolated cypreptide encoded by the novel polynucleotide, or a polynucleotide cypreptide encoded by the novel polynucleotide, or a polynucleotide; and carrier; an antibody composition comprising the polypeptide and a carrier; an antibody composition comprising the polypeptide and a carrier; an antibody directed against the polypeptide; a method for detecting the novel composition comprising the polypeptide; a method for identifying a compound that binds to the polypeptide is a method for identifying a compound that binds to the polypeptide; a method for producing the polypeptide; an isolated polypeptide in a sample; a method for identifying a compound that binds to the polypeptide is a method for producing the polypeptide; an isolated polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotides encoding a polypeptide with biological activity, useful for treating inflammation, leukemias, nervous system disorders, or infections.

comprising any of the 235 amino acid sequences described in the specification; and a collection above. The polymuclassing of at least one of the polymucleotides cited above. The polymptides and polymucleotides of the invention have antiinflammatory, cytostatic, and antimicrobial activities. The novel polymucleotide may be used to treat disorders by gene therapy. The polymptides and polymucleotides are useful for treating inflammation, leakemakes, nervous system disorders, or infections. This sequence represents one of the 235 novel isolated

procollagen. The present invention relates to antisense oligonucleotides (ASOS) and their use in inhibiting expression of type I procollagen. The ASOS comprise 18-25 nucleotides and are complementary to a specific region within the type I collagen pro-alpha-1 chain gene (see AAF90491), especially those given in AAF90492-503. They are capable of inhibiting the expression of the pro-alpha-1 chain in a cell that expresses it. The ASOS are used in a claimed method of treating, or reducing a risk of, a collagen disorder. Such disorders may include those caused by overproduction of collagen fibres, such as liver cirrhosis, kidney, liver and heart fibrosis, scleroderma, hypertrophic scars and keloids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1400 AEGNSRFTYSVTVDGCTSHTGAWGKTVIEYKTTKSSRLPIIDVAPLDVGAPDQEFGFDVG 1459

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ठे
                                                                                                                                                                                                                                                                                                 The invention relates to an isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumour endothelial marker (TEM) protein selected from ABB90732, ABB90740, ABB90749, ABB90749, ABB90749, ABB90760 and ABB90769. The antibodies which bind to TEM proteins have cytostatic, immunostimulant and antianglogenic activity. They are useful for inhibiting tumour growth, neoanglogenesis in subjects bearing a vascularised tumour, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis and psoriasis. Human, mouse and rat TEM genes and the encoded proteins (ABL92075-ABL92141 and ABB90721-ABB90789) are disclosed, as are marker oligonucleotide sequences: tumour endothelial markers (TEM) ABL91996-ABL92041 and ABL93143-ABL92191; normal (PEM) ABL91903-ABL92104; and pan-endothelial markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1400 AEGNSRFTYSVTVDGCTSHTGAMGKTVIEYKTTKSSRLPIIDVAPLDVGAPDQEFGFDVG 1459

The invention relates to an isolated polynucleotide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (d) sequences consisting of at least 20 contiguous residues of (a); (d) sequences that hybridize to (a), under moderately tringent conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP68596-CAPR6837) encoded by (I) and oligonucleotide can be used to detect cancer in a patient and compositions comprising polypeptides, polymocleotides, antibodies, tusion proteins, T cell populations and antigen presenting cells expressing the polypeptide are useful in treating pancreatic cancer and stimulating an immune response. The polymucleotides can be used as probes or primers for nucleic acid hybridisation, in the design and proteins in the tumour cells, in vaccines and for gene polypeptides and proteins in the tumour cells, in vaccines and for gene therapy. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              242

                                                                                                                                                                                                                                                                                                                                                                                                                   New purified human transmembrane protein, designated as tumor endothelial marker (TEM) 3, useful for detecting, diagnosing or treating tumors, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a novel method for the isolation of endothelial cells (ECs), and the identification of genes expressed in normal and tumour ECs. Tumour endothelial marker (TEM), normal endothelial marker (TEM), normal endothelial marker (PEM) genes are identified in human ECs. The human EC marker proteins and the polynucleotide sequences encoding them are useful for detecting, diagnosing or treating tumours as well as polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis, and psoriasis. They are also useful for inhibiting neoanglogenesis or tumour angiogenesis, for inducing an immune response to tumour endothelial cells in a patient, or

                                                                                                   expression
                                                                                                                                                                                                                                                                                 The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACC50076 to ACC5034 and ABR47386 to ABR4738) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a pignificant increase in the level of expression of the marker in the patient sample and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        QCCNLDAIKVFCNMETGETCVYPTQPSVAQKNWYISKNPKDKRHVWFGESMTDGFQFEYG 122

given in ABR92047 to ABR92164. A higher level of expression of (I) than

corrmal indicates the presence of cervical cancer. Also described: (I) a

vector (II) containing (I); (2) a host cell (III) containing (I); and (3)

cassessing (MI) whether a patient is afflicted with cervical cancer,

comprising comparing the level of expression of a marker in a patient's

sample, and the normal level of expression of the marker in a control non

cervical cancer sample, where a significant increase in the level of

corrical cancer in the patient's sample relative to that in the

control sample is an indication that the patient is afflicted with

cervical cancer. (I) has cytostatic activity, and can be used in gene

therapy and in vaccines. (I) is useful in detecting, characterising,

therapy and treating human cervical cancers. (I) may also be used in

various prognostic and diagnostic assays, pharmacogenomics and in

monitoring clinical trials

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A; Description: structural component of extracellular fibrous polymer that maintains inters. Superfamily: collagen alpha 1(I) chain; fibrillar collagen carboxyl-terminal homology; C; Reywords: coiled coil; Ehlers-Danlos syndrome; extracellular matrix; glycoprotein; hyd F; 1-23/Domain: signal sequence #status predicted <815.
F; 24-153/Domain: amino-terminal propeptide #status predicted <PRO>F; 1-21/Product: collagen alpha 1(III) chain #status predicted <PRO>F; 154-157/Product: collagen alpha 1(III) chain #status predicted <MAT>F; 154-167/Region: amino-terminal nonhelical telopeptide

"Analysis of the COLIA1 and COLIA2 genes by PCR amplification and
scanning by conformation-sensitive gel electrophoresis identifies only
COLIA1 mutations in 15 patients with osteogenesis imperfecta type I:
identification of common sequences of null-allele mutations.";
Am. J. Hum. Genet. 62:98-110(1998).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Homo sapiens (Human).

-1- SUBUNIT: Trimers of one alpha 2(1) and two alpha 1(1) chains.
-1- PTM: POOLines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
-1- DISEASE: Defects in COLIA1 are a cause of osteogenesis imperfects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3 DANVVRDRDLEVDTTLKSLSQQIENIRSPEGSRKNPARTCRDLKMCHSDWKSGEYWIDPN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hydroxyapatite.

-!- PTM: Proline residues at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains. Pro-1153 is the only 3-hydroxypro and the only hydroxypro proline in position X.

-!- SIMILARITY: Belongs to the fibrillar collagen family.
-!- SIMILARITY: Contains 1 VWFC domain.
                                                                                                                                                 MEDLINE-88007542; PubMed=2820966; Finer M.H., Abo S., Gerstenfeld L.C., Boedtker H., Doty P.; "Unmual DNA sequences located within the promoter region and first intron of the chicken pro-alpha 1(I) collagen gene."; J. Sequence 18, Application US/09570573

Patent No. 6342361

GENERAL INFORMATION

APPLICANT: Bonde, Martin

TITLE OF INVENTION: A Method for Assaying Collagen Fragments

TITLE OF INVENTION: In Body Fluids, A Test Kit and Means for Carr

TITLE OF INVENTION: Disorders Associated with the Metabolism of

TITLE OF INVENTION: Disorders Associated with the Metabolism of

NUMBER OF SEQUENCES: 21

Patent No. 6110689

GENERAL INFORMATION:
APPLICANT: Oviet, Per
APPLICANT: Bonde, Martin
TITLE OF INVENTION: A Method for Assaying Collagen Fragments
TITLE OF INVENTION: Method and Use of the Method to Diagnose the Presence of
TITLE OF INVENTION: Disorders Associated with the Metabolism of
CORRESPONDENCE ADDRESS:

GENERAL INFORMATION:

APPLICATION:

TITLE OF INVENTION: Methods and composition for producing secreted trimeric

TITLE OF INVENTION: receptor analogs and biologically active fusion proteins

TITLE OF INVENTION: VANDER: US/10/677,877A

CURRENT APPLICATION NUMBER: US/10/677,877A

CURRENT FILING DATE: 2003-10-02

NUMBER OF SEQ ID NOS: 16

SEQ ID NO 4

LENGTH: 247
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             US-10-677-877A-16

                                                                                                                                                                                                                                                                                                                                                                                             Sequence 2, Application US/10677877A

Publication No. US20050202537A1

GENERAL INFORMATION:

APPLICANT: Liang, Peng; GenHunter Corporation

TITLE OF INVENTION: methods and composition for producing secreted trimeric

TITLE OF INVENTION: receptor analogs and biologically active fusion proteins

FILE REFERENCE: 03-052-PL

CURRENT APPLICATION NUMBER: US/10/677,877A

CURRENT APPLICATION DATE: 2003-10-02

NUMBER OF SEQ ID NOS: 16

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                           US-10-677-877A-4
